

Compile and Run C Programs

To compile and run a C language program, you need a C compiler. A compiler is software that is used to compile and execute programs. To set up a C language compiler on your Computer/laptop, there are two ways:

Options for Setting Up C Compiler

IDE with Built-in Compiler

Command Line Compiler

Using any text editor and downloading a C compiler separately

Using an IDE like Turbo C++ or Microsoft Visual C++ or DevC++, which comes along with a C language compiler

Using an IDE - Turbo C or Turbo C++ for C Language

We will recommend you to use Turbo C or Turbo C++ IDE, which is good for a beginner. It is freely available over the Internet.

Common IDE Options

Most IDEs provide similar options for compiling and running programs:

Compilation Options

- Compile: Translates source code to machine code
- Build: Creates executable file
- Run: Executes the program
- Debug: Helps identify and fix errors
- Project Management: Organizes files and resources

When you compile your program, the compiler generates an object file with a .obj extension, which is later linked with libraries to create the final executable.
